H9 Portable lighting tool

Project based on **Fillipo Pagliai's** idea

Designed by **Luisa Baldassari** for **Grado Zero Espace**, under the supervision of **Giada Dammacco**
Electronics developed by **Giulia Bimbi**.

H9 is a bright shell to wear over any type of glove or directly on the naked hand.

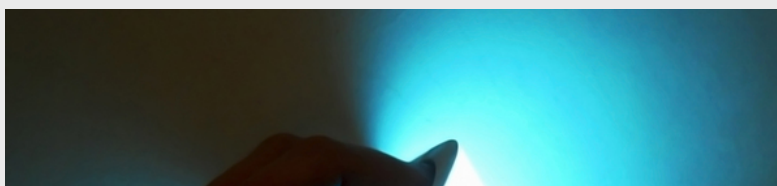

H9 is a light source of the latest generation, soft and foldable, consisting of a woven fiber glass on which is deposited a micro-layer of electroluminescent material and when it's appropriately stimulated creates uniformly illuminated surfaces.

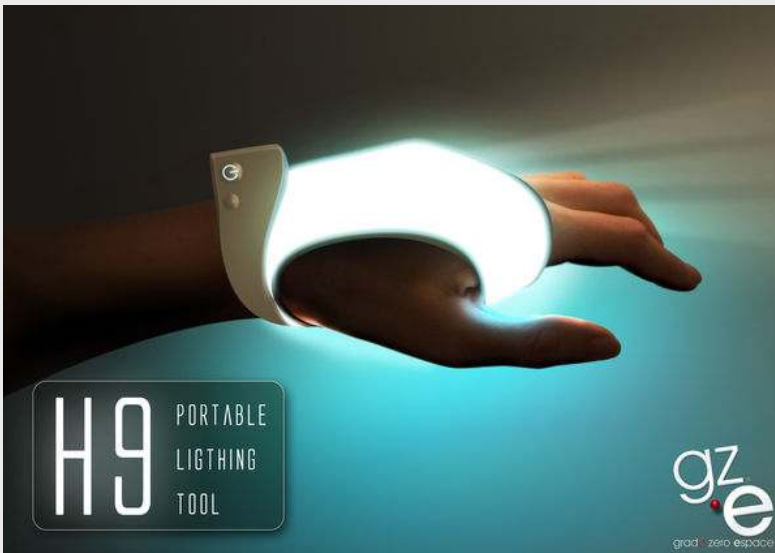

The idea comes from the necessity to increase the visibility and the safety of the person which operates in low bright conditions or in the darkness, through a luminous device that generates light without compromise the mobility of the hand, since it becomes an integral part of the hand.

For the first time, a light source becomes a wearable tool that adapts to the movements of hand, as only a fabric and can be.

The idea comes from the necessity to increase the visibility and the safety of the person which operates in low bright conditions or in the darkness, through a luminous device that generates light without compromise the mobility of the hand, since it becomes an integral part of the hand.

For the first time, a light source becomes a wearable tool that adapts to the movements of hand, as only a fabric and can do.

H9 can be used in different application scenarios.

H9 PORTABLE LIGHTING TOOL

H9 PORTABLE LIGHTING TOOL

H9 RECHARGER

H9 can be recharged easily without need of power sockets, thanks to its compact solar recharger with three photovoltaic modules and an accumulator.

The charging process is simple and easy: just connect your charger to H9 using the appropriate jack, without having to remove the batteries from the interior.

Thanks to its small size, H9 recharger becomes a keyring.
